Thermodynamics is the branch of physics that has to do with heat and temperature and their relation to energy and work. The behavior of these quantities is governed by the four laws of thermodynamics, irrespective of the composition or specific properties of the material or system in question. The laws of thermodynamics are explained in terms of microscopic constituents by statistical mechanics.

In thermodynamics, a critical point (or critical state) is the end point of a phase equilibrium curve. The most prominent example is the liquid-vapor critical point, the end point of the pressure-temperature curve that designates conditions under which a liquid and its vapor can coexist. At higher temperatures, the gas cannot be liquefied by pressure alone.

La termodinámica es una materia excitante y fascinante que trata sobre la energía, la cual es esencial para la conservación de la vida mientras que la termodinámica ha sido por mucho tiempo una parte fundamental de los programas de estudio de ingeniería en todo el mundo.

Thermal Equilibrium: the point at which, in the system (as in two bonded human molecules), no heat [Q] moves from one body or region to the other. Specifically, a state in which the energy distribution of the system equals a Maxwell-Boltzmann distribution. This allows a single temperature to be attributed to the system.

Specific Gravity (SG) is a special case of relative density.. It is defined as the ratio of the density of a given substance, to the density of water (H<sub>2</sub>O). Substances with a specific gravity greater than 1 are heavier than water, and those with a specific gravity of less than 1 are lighter than water.
