Overview. Thermal radiation, also known as heat, is the emission of electromagnetic waves from all matter that has a temperature greater than absolute zero. It represents the conversion of thermal energy into electromagnetic energy. Thermal energy consists of the kinetic energy of random movements of atoms and molecules in matter.

Heat pipes are recognised as one of the most efficient passive heat transfer technologies available. A heat pipe is a structure with very high thermal conductivity that enables the transportation of heat whilst maintaining almost uniform temperature along its heated and cooled sections.

Fresh analysis of government scientific records reveals the idea of 'long-settled' science in the greenhouse gas theory is a myth. The claim human emissions of carbon dioxide (CO₂) acts as a control knob on climate only appeared in consensus science since the 1980's. Prior to that time, official records show the theory as "abandoned."
