Thermal conduction is the transfer of heat (internal energy) by microscopic collisions of particles and movement of electrons within a body. The microscopically colliding particles, that include molecules, atoms and electrons, transfer disorganized microscopic kinetic and potential energy, jointly known as internal energy.

Fig. 2 shows the porous heating panel that was fabricated for both experiments presented in this paper. The water is dyed to highlight the circuit, which was designed to ensure an even temperature distribution, following a method described by . The panel is 15 cm \times 15 cm and the fluid channels are 2 mm wide and 1 mm deep. There are 144 holes, spaced evenly at 1 cm centers, each 2.52 mm in diameter.

Fouling is the accumulation of unwanted material on solid surfaces to the detriment of function. The fouling materials can consist of either living organisms or a non-living substance (inorganic and/or organic). Fouling is usually distinguished from other surface-growth phenomena, in that it occurs on a surface of a component, system or plant performing a defined and useful function, and that ...

Mother Nature routinely deals with huge amounts of energy. In the case of hurricanes, some of the solar energy stored in the upper ocean is rapidly removed by strong winds in the form of evaporated water vapor, which then feeds the hurricane as the vapor condenses into rain and the latent heat of condensation is released.
