Numerical analysis is the study of algorithms that use numerical approximation (as opposed to general symbolic manipulations) for the problems of mathematical analysis (as distinguished from discrete mathematics). Numerical analysis naturally finds application in all fields of engineering and the physical sciences, but in the 21st century also the life sciences, social sciences, medicine ...

Numerical methods for ordinary differential equations are methods used to find numerical approximations to the solutions of ordinary differential equations (ODEs). Their use is also known as "numerical integration", although this term is sometimes taken to mean the computation of integrals. Many differential equations cannot be solved using symbolic computation ("analysis").

The most common way of computing numerical derivative of a function at any point is to approximate by

some polynomial in the neighborhood of  $\alpha$ . It is expected that if selected neighborhood of  $\alpha$  is sufficiently small then approximates near well and we can assume that  $f(\alpha) \neq 0$ . Let's consider this approach in details (or go directly to the table of formulas).. At first, we sample at the  $(\alpha + h)$  (is odd ...

Hi Pavel. Nice work. I'm using it now to compute the velocity of a robot (MBARS) and your methods give very good results. I'd like to know if you have the formula of a one-sided version, as using a centered version forces me to introduce a time lag.
