We consider a random variable x and a data set $S = \{x_1, x_2, \dots, x_n\}$ of size n which contains possible values of x . The data set can represent either the population being studied or a sample drawn from the population. Looking at S as representing a distribution, the skewness of S is a measure of symmetry while kurtosis is a measure of peakedness of the data in S .

We consider a random variable x and a data set $S = \{x_1, x_2, \dots, x_n\}$ of size n which contains possible values of x . The data set can represent either the population being studied or a sample drawn from the population. The mean is the statistic used most often to characterize the center of the data in S . We now consider the following commonly used measures of variability of the data around the ...

Test Statistics The stats program works out the p value either directly for the statistic you're interested in (e.g. a correlation), or for a test statistic that has a 1:1 relationship with the effect statistic. A test statistic is just another kind of effect statistic, one that is easier for statisticians and computers to handle. Common test statistics are t, F, and chi-squared.

Statistics are supposed to make something easier to understand but when used in a misleading fashion can trick the casual observer into believing something other than what the data shows. That is, a misuse of statistics occurs when a statistical argument asserts a falsehood. In some cases, the misuse may be accidental. In others, it is purposeful and for the gain of the perpetrator.
